

## Description

The Front Withdrawal Frame is designed to hold various types of air filters including disposable glass or pleated panels, bag filters or a combination of both.

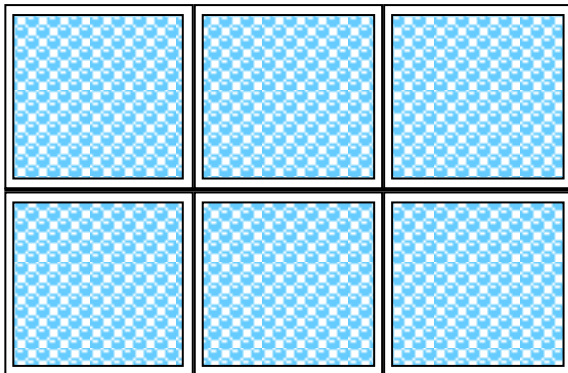

## Construction

Front Withdrawal Frames are generally manufactured from galvanised steel as standard but are also available in stainless steel depending on the application. Each frame comes complete with 4 retaining 'P' clips and a self adhesive sealing gasket onto which the filter seals.

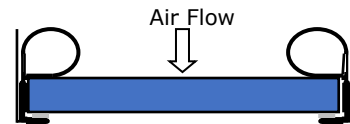

Frames are generally supplied as single units for ease of construction on site.

Available in a range of standard sizes and also produced to almost any practical size.

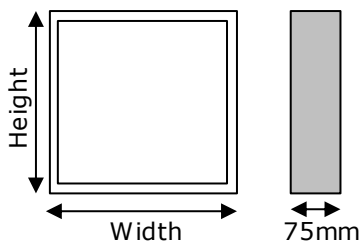

## Assembly

Multiple frame assemblies may be bolted or riveted together making sure an 1.2mm sheet metal stiffening strip is fixed between each layer of frames to eradicate any movement. To reduce site labour, frame assemblies can be made in one piece or in sections ready to install on site.

## Dimensions

## Clips
